Lepidopteran-active Bacillus thuringiensis delta-endotoxin polypeptides and the polynucleotides that encode them, useful for increasing the resistance of plant -

Claim 5; Page 102-103; 173pp; English.

thuringiensis delta-endotoxin polypeptides may be used as compositions that are applied to plant crops to protect them from insect damage. The polymcleotides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monococyledonous or dicotyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcame, tomato, tobacco, kapok, flax, potato, barley, turf grass, pasture grass, berry, truit, legume, vegetable, ornamental plant, shrub, cactus and/or tree cell. A wide range of insects (e.g. gypsy moth, looper, tobacco budworm, cotton leaf perforator and spruce budworm) may be affected by application of the insecticidal polypeptides (full details given in specification). The sequence represents a B. thuringiensis Lepidopteran-active B. delta-endotoxin, crystal protein CrysT31. The Lepidopteran-active B.

```

Sequence 633 AA;

(Updated on 25-MAR-2003 to correct PF field.)

This sequence shows the amino acid sequence of CryIIA protein. The CryIIA gene was used as a probe to identify CryIIA related sequences, ie. CryIIB. CryIIB encodes an insecticidal crystal protein feolated from Bacillus thuringiensis var. kurstaki. It produces crystal proteins during sporulation which are specifically coxic to certain orders and species of insects, esp. Lepidopterans. CryIIB can be used in compositions used as environmentally acceptabl insecticides. (See also AAR56597-8)

acceptable

New Cry IIB protein - obtd. from the cry II B gene in Bacillus thuringiensis var. Kurstaki, active against lepidopteran insects

Example 2; Fig 2A-2C; 39pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, kapok, flax, potato, barley, turf grass, pasture grass, berry, fruit, legume, vegetable, ornamental plant, shrub, cactus and/or tree cell. A wide range of insects (e.g. gypsy moth, looper, tobacco budworm, cotton leaf perforator and spruce budworm) may be affected by application of the insecticidal polypeptides (full details given in specification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polynucleotides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicotyledonous plants may be protected in this way, for example corn,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Match 91.9%; Score 3046.5; DB 22; Length 635; Local_Similarity 90.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       contains the present sequence. The cry2ha gene would be transferred into plants via expression vectors, which subsequently allow high expression of the cry2ha gene. The present sequence lacks Dipteran inhibitory activaty. Protection may be attained against insects such as Ostrina spp., Diatraca spp., Helicoverapa spp., and Spodoptera spp., in Zea mays, Heliothis virescens, Helicoverapa spp., and Spodoptera spp., in Gossypium hirsutum; Anticarsi spp., Pseudoplusia spp., Epinotia spp., in Glycine max; and Scirpophaga incertulas in Oryza sativa. Expression of the cry2ha gene by a plant cell produces a fusion protein comprising an amino-terminal plastid transit peptide (PTP) covalently linked to the delta-endotoxin. The fusion protein functions to localise the delta-endotoxin to a subcellular organelle or compartment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is cry2Aa delta-endotoxin protein. Delta-endotoxins are produced by Bacillus thuringiensis during sporulation. These proteins are toxic to certain species of insect e.g. Lepidopteran and Coleopteran larvae. An insect resistant transgenic plant has been constructed which contains the present sequence. The cry2Aa gene would be transferred into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          04-NOV-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200026371-A1.

                              This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  contains the cry2Ab gene. The cry2Ab gene would be transferred into plants via expression vectors, which subsequently allow high expression of the cry2Ab gene. The present sequence lacks Dipteran inhibitory activity. Protection may be attained against insects such as Ostrina spp., Diatrace spp., Helicoverpa spp., and Spodoptera spp., in Zea mays; Heliothis virescens, Helicovera spp., Fectinophora spp., in Gossypium hirsutum; Anticaral spp., Pseudophisia spp., Epinotia spp., in Glycine max; and Scirpophaga incertulas in Oryza sativa. Expression of the cry2Ab gene by a plant cell produces a fusion protein comprising an amino-terminal plastid transit peptide (PTP) covalently linked to the delta-endotoxin. The fusion protein functions to localise the delta-endotoxin to a subcellular organelle or compartment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               produced by Bacillus thuringiensis during sporulation. These proteins are toxic to certain species of insect e.g. Lepidopteran and Coleopteran larvae. An insect-resistant transgenic plant has been constructed which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New method of expressing insecticidal proteins in plants transformed with a Bacillus thuringiensis delta-endotoxin encoding gene resulting in effective control of susceptible target pests
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the Cry2Ab delta-endotoxin. Delta-endotoxins are

                                                                                                                                                                                                                                                                                                                                                     contains the cry2Ab gene. The cry2Ab gene would be transferred into plants via expression vectors, which subsequently allow high expression of the cry2Ab gene. The present sequence lacks Dipteran inhibitory activity. Protection may be attained against insects such as Ostrina spp., Diatrace spp., Helicoveraps spp., and Spodoptera spp., in Zea mays; Heliothis virescens, Helicoveraps spp., Pectinophora spp., in Gossypium hirsutum; Anticarsi spp., Pseudoplusia spp., Epinotia spp., in Glycine max; and Scirpophaga incertulas in Oryza sativa. Expression of the cry2Ab gene by a plant cell produces a fusion protein comprising an amino-terminal plastid transit peptide (PTP) covalently linked to the delta-endotoxin. The fusion protein functions to localise the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New method of expressing insecticidal proteins in plants transformed with a Bacillus thuringiensis delta-endotoxin encoding gene resulting in effective control of susceptible target pests
                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the Cry2Ab delta-endotoxin. Delta-endotoxins are produced by Bacillus thuringiensis during sporulation. These proteins are toxic to certain species of insect e.g. Lepidopteran and Coleopteran larvae. An insect-resistant transgenic plant has been constructed which

                                                                                                Amino acid sequence of lepidoteran-active 8612 toxin.
                                                                                                                             02-DEC-1998 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The cryIIb gene was isolated from a B.t. strain using the cryIIa gene as probe. The cryIIb gene encodes a 633 amino acid protein of calculated mol. wt. 70,749. The insecticidal toxin CryIIB is twice as toxic as the CryIIA protein against the lepidopteran Heliothis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Hellothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of the coxins and the primers, together with probes derived from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New insecticidal Bacillus thuringiensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis,

                                                                                                                                                                                                                                                                                                                                                                                                                        This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW75774 standard; Protein; 633 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New insecticidal Bacillus thuringiensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis, Heliothis virescens and Helicoverpa zea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacillus thuringiensis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      lepidoptera; pest; pesticide; C
Helicoverpa zea; hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HD525 toxin; PCR; primer; amplification; Bacillus thuringiensis; probe;

New insecticidal Bacillus thuringiensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis, Heliothis virescens and Helicoverpa zea

Claim 14; Pages 28-30; 50pp; English.

This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The

The polynucleotides may be used in the production of transgenic plants that express the insecticidal polypeptides and consequently have improved insect resistance compared to non-transformed plants. Monocotyledonous or dicotyledonous plants may be protected in this way, for example corn, wheat, soybean, oat, cotton, rice, rye, sorghum, sugarcane, tomato, tobacco, kapok, flax, potato, barley, turf grass, pasture grass, berry, fruit, legume, vegetable, ornamental plant, shrub, cactus and/or tree cell. A wide range of insects (e.g. gypsy moth, looper, tobacco budworm, cotton leaf perforator and spruce budworm) may be affected by application of the insecticidal polypeptides (full details given in specification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                        A gene for Bacillus thuringiensis (B.t) P-2 toxin having the DNA sequence specified in Fig 2 (AAN80591), or any portion or deriv. of it, is claimed. Also claimed is the protein encoded by the gene, having the corresponding specified AA sequence in AAP83002. In isolating the P-2 gene, the P-2 protein was purified from a donor strain of B.t var. kustaki and the partial AA sequence of the P-2 protein was determined. P-2 gene-specific Oligo probe (AAN80590) was synthesised based on the AA sequence. The P-2 toxin encoded by the cloned gene has insecticidal activity against lepidoptera and diptera insects.

N.B. The DNA/protein sequence in AAN80591/P83002 is as given in the specifications and is missing bases 901-1000 and the corresp. AAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAP83002 standard; protein; 290 AA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Melolontha spp. (e.g. maybugs, cockchafers) which are pests of agriculture and forestry. The protein can inhibit eating, killing both adult beetles and larvae. It can be incorporated into eradication programmes involving Bacillus popilliae and Bacillus thuringiensis spores, fungal spores or cytolysing proteins in the form of a fusion protein. The DNA can also be used to produce transgenic plants that are resistant to attack by the beetles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a novel bacterial crystal protein which can be used to control beetles of the family Scarabaeidae, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Melolontha spp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding Bacillus popillae crystal protein - for production of recombinant protein and transgenic plants resistant to attack by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 8; Pages 8-11; 12pp; German.

                                                                                                                                                                                                                                                                                                                                                            A gene for Bacillus thuringiensis (B.t) P-2 toxin having the DNA sequence specified in Fig 2 (AAN80591), or any portion or deriv. of it, is Claimed. Also claimed is the protein encoded by the gene, having the corresponding specified AA sequence in AAP80548. In isolating the P-2 gene, the P-2 protein was purified from a donor strain of B.t var. kurstaki and the partial AA sequence of the P-2 protein was determined. P-2 gene-specific oligo probe (AAN80590) was synthesised based on the AA sequence. The P-2 toxin encoded by the cloned gene has insecticidal
                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                            activity against lepidoptera and diptera insects. SQ corresponds to residues 162-260 of the P-2 protein.

US-09-186-002-12

TYPE: PRT

ORGANISM: Bacillus thuringiensis

GENERAL INFORMATION:
APPLICANT: Corbin, David R.
APPLICANT: Corbin, David R.
APPLICANT: Romano, Charles P.
APPLICANT: Romano, Charles P.
TITLE OF INVENTION: Improved Method for Transforming Plants to Express
TITLE OF INVENTION: delta-Endotoxins
FILE REFERENCE: 38-21(13547) US Pat No. 6489542 09/186,002
CURRENT APPLICATION NUMBER: US/09/186,002B
CURRENT FILING DATE: 1998-11-04
NUMBER OF SEQ ID NOS: 18
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 12
LENGTH: 634
